

## Chapter 3, Part A

# Descriptive Statistics: Numerical Measures(數值方法)

- Measures of Location
- Measures of Variability

# Numerical Measures

- If the measures are computed for data from a sample, they are called sample statistics.
- If the measures are computed for data from a population, they are called population parameters.
- A sample statistic is referred to as the point estimator of the corresponding population parameter.

# Measures of Location

- Mean
- Median
- Mode
- Weighted Mean
- Geometric Mean
- Percentiles
- Quartiles

# Mean

- Perhaps the most important measure of location is the mean.
- The mean provides a measure of central location.
- The mean of a data set is the average of all the data values.
- The sample mean  $\bar{x}$  is the point estimator of the population mean  $\mu$ .

## Sample Mean $\bar{x}$

$$\bar{x} = \frac{\sum x_i}{n}$$

where:  $\sum x_i$  = sum of the values of  $n$  observations  
 $n$  = number of observations in the sample

## Population Mean $\mu$

$$\mu = \frac{\sum x_i}{N}$$

where:  $\sum x_i$  = sum of the values of the  $N$  observations  
 $N$  = number of observations in the population

## Sample Mean $\bar{x}$

- Example: Apartment Rents

Seventy efficiency apartments were randomly sampled in a college town. The monthly rents for these apartments are listed below.

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 545 | 715 | 530 | 690 | 535 | 700 | 560 | 700 | 540 | 715 |
| 540 | 540 | 540 | 625 | 525 | 545 | 675 | 545 | 550 | 550 |
| 565 | 550 | 625 | 550 | 550 | 560 | 535 | 560 | 565 | 580 |
| 550 | 570 | 590 | 572 | 575 | 575 | 600 | 580 | 670 | 565 |
| 700 | 585 | 680 | 570 | 590 | 600 | 649 | 600 | 600 | 580 |
| 670 | 615 | 550 | 545 | 625 | 635 | 575 | 650 | 580 | 610 |
| 610 | 675 | 590 | 535 | 700 | 535 | 545 | 535 | 530 | 540 |

$$\bar{x} = \frac{\sum x_i}{n} = \frac{41,356}{70} = 590.80$$

79 87#75#79#55

$$\bar{x} = \frac{46 + 54 + 42 + 46 + 32}{5} = 44$$

**FIGURE 3.1** THE MEAN AS THE CENTER OF BALANCE FOR THE DOT PLOT OF THE CLASSROOM SIZE DATA

79#~~44~~7 75#79#55

$$\bar{x} = \frac{46 + \mathbf{114} + 42 + 46 + 32}{5} = \mathbf{56}$$

# Median

- The median of a data set is the value in the middle when the data items are arranged in ascending order.
- Whenever a data set has **extreme values**, the median is the preferred measure of central location.
- The median is the measure of location most often reported for annual income and property value data.
- A few extremely large incomes or property values can inflate the mean.

# Median

- For an odd number of observations:

|    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|
| 26 | 18 | 27 | 12 | 14 | 27 | 19 |
|----|----|----|----|----|----|----|

7 observations

|    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|
| 12 | 14 | 18 | 19 | 26 | 27 | 27 |
|----|----|----|----|----|----|----|

in ascending order

The median is the middle value. Median = 19

# Median

- For an even number of observations:

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|
| 26 | 18 | 27 | 12 | 14 | 27 | 30 | 19 |
|----|----|----|----|----|----|----|----|

8 observations

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|
| 12 | 14 | 18 | 19 | 26 | 27 | 27 | 30 |
|----|----|----|----|----|----|----|----|

in ascending order

The median is the average of the two middle values.

$$\text{Median} = (19 + 26)/2 = 22.5$$

# Median

- Example: Apartment Rents

Averaging the 35th and 36th data values:

$$\text{Median} = (575 + 575)/2 = 575$$

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 525 | 530 | 530 | 535 | 535 | 535 | 535 | 535 | 540 | 540 |
| 540 | 540 | 540 | 545 | 545 | 545 | 545 | 545 | 550 | 550 |
| 550 | 550 | 550 | 550 | 550 | 560 | 560 | 560 | 565 | 565 |
| 565 | 570 | 570 | 572 | 575 | 575 | 575 | 580 | 580 | 580 |
| 580 | 585 | 590 | 590 | 590 | 600 | 600 | 600 | 600 | 610 |
| 610 | 615 | 625 | 625 | 625 | 635 | 649 | 650 | 670 | 670 |
| 675 | 675 | 680 | 690 | 700 | 700 | 700 | 700 | 715 | 715 |

Note: Data is in ascending order.

## Trimmed Mean

- Another measure, sometimes used when extreme values are present, is the trimmed mean.
- It is obtained by deleting a percentage of the smallest and largest values from a data set and then computing the mean of the remaining values.
- For example, the 5% trimmed mean is obtained by removing the smallest 5% and the largest 5% of the data values and then computing the mean of the remaining values.

# Mode

- The mode of a data set is the value that occurs with greatest frequency.
- The greatest frequency can occur at two or more different values.
- If the data have exactly two modes, the data are bimodal.
- If the data have more than two modes, the data are multimodal.

# Mode

- Example: Apartment Rents

550 occurred most frequently (7 times)

Mode = 550

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 525 | 530 | 530 | 535 | 535 | 535 | 535 | 535 | 540 | 540 |
| 540 | 540 | 540 | 545 | 545 | 545 | 545 | 545 | 550 | 550 |
| 550 | 550 | 550 | 550 | 550 | 560 | 560 | 560 | 565 | 565 |
| 565 | 570 | 570 | 572 | 575 | 575 | 575 | 580 | 580 | 580 |
| 580 | 585 | 590 | 590 | 590 | 600 | 600 | 600 | 600 | 610 |
| 610 | 615 | 625 | 625 | 625 | 635 | 649 | 650 | 670 | 670 |
| 675 | 675 | 680 | 690 | 700 | 700 | 700 | 700 | 715 | 715 |

Note: Data is in ascending order.

## Weighted Mean

- In some instances the mean is computed by giving each observation a weight that reflects its relative importance.
- The choice of weights depends on the application.
- The weights might be the number of credit hours earned for each grade, as in GPA.
- In other weighted mean computations, quantities such as pounds, dollars, or volume are frequently used.

## Weighted Mean

$$\bar{x} = \frac{\sum w_i x_i}{\sum w_i}$$

where:  $x_i$  = value of observation  $i$

$w_i$  = weight for observation  $i$

Numerator: sum of the weighted data values

Denominator: sum of the weights

If data is from a population,  $\mu$  replaces  $\bar{x}$ .

## Weighted Mean

- Example: Construction Wages

Ron Butler, a home builder, is looking over the expenses he incurred for a house he just built. For the purpose of pricing future projects, he would like to know the average wage (\$/hour) he paid the workers he employed. Listed below are the categories of workers he employed, along with their respective wage and total hours worked.

| <u>Worker</u> | <u>Wage (\$/hr)</u> | <u>Total Hours</u> |
|---------------|---------------------|--------------------|
| Carpenter     | 21.60               | 520                |
| Electrician   | 28.72               | 230                |
| Laborer       | 11.80               | 410                |
| Painter       | 19.75               | 270                |
| Plumber       | 24.16               | 160                |

## Weighted Mean

- Example: Construction Wages

| Worker      | $x_i$ | $w_i$ | $w_i x_i$ |
|-------------|-------|-------|-----------|
| Carpenter   | 21.60 | 520   | 11232.0   |
| Electrician | 28.72 | 230   | 6605.6    |
| Laborer     | 11.80 | 410   | 4838.0    |
| Painter     | 19.75 | 270   | 5332.5    |
| Plumber     | 24.16 | 160   | 3865.6    |
|             |       | 1590  | 31873.7   |

$$\bar{x} = \frac{\sum w_i x_i}{\sum w_i} = \frac{31,873.7}{1,590} = 20.0464 = \$20.05$$

FYI, equally-weighted (simple) mean = \$21.21

## Geometric Mean

- The geometric mean is calculated by finding the  $n$ th root of the product of  $n$  values.
- It is often used in analyzing growth rates in financial data (where using the arithmetic mean will provide misleading results).
- It should be applied anytime you want to determine the mean rate of change over several successive periods (be it years, quarters, weeks, . . .).
- Other common applications include: changes in populations of species, crop yields, pollution levels, and birth and death rates.

$$\begin{aligned}\bar{x}_g &= \sqrt[n]{(x_1)(x_2) \dots (x_n)} \\ &= [(x_1)(x_2) \dots (x_n)]^{1/n}\end{aligned}$$

## Geometric Mean

- Example: Rate of Return

| Period | Return (%) |   | (1 + Return%)<br>Growth Factor |
|--------|------------|---|--------------------------------|
| 1      | -6.0       |  | 0.940                          |
| 2      | -8.0       |   | 0.920                          |
| 3      | -4.0       |   | 0.960                          |
| 4      | 2.0        |   | 1.020                          |
| 5      | 5.4        |   | 1.054                          |

$$\begin{aligned}\bar{x}_g &= \sqrt[5]{(.94)(.92)(.96)(1.02)(1.054)} \\ &= [.89254]^{1/5} = .97752\end{aligned}$$

Average growth rate per period is  $(.97752 - 1) (100) = -2.248\%$

## Exercise

Annual revenue for Corning Supplies grew by 5.5% in 2007; 1.1% in 2008; -3.5% in 2009; -1.1% in 2010; and 1.8% in 2011. What is the mean growth annual rate over this period?

**TABLE 3.2** PERCENTAGE ANNUAL RETURNS AND GROWTH FACTORS FOR THE MUTUAL FUND DATA

| Year | Return (%) | (1 + Return%)<br>Growth Factor |
|------|------------|--------------------------------|
| 1    | -22.1      | 0.779                          |
| 2    | 28.7       | 1.287                          |
| 3    | 10.9       | 1.109                          |
| 4    | 4.9        | 1.049                          |
| 5    | 15.8       | 1.158                          |
| 6    | 5.5        | 1.055                          |
| 7    | -37.0      | 0.630                          |
| 8    | 26.5       | 1.265                          |
| 9    | 15.1       | 1.151                          |
| 10   | 2.1        | 1.021                          |

$$\$100 - .221(\$100) = \$100(1 - .221) = \$100(.779) = \$77.90$$

$$\$77.90 + .287(77.90) = 77.90(1 + .287) = \$77.90(1.287) = \$100.2573$$

$$\$100(.779)(1.287) = \$100.2573$$

$$\textbf{\$100[(.779)(1.287) \cdots (1.021)] = \$100(1.334493) = \$133.4493}$$

$$\bar{x}_g = \sqrt[10]{1.334493} = 1.029275$$

$$\text{Average annual rate} = (1.029275 - 1)100\% = 2.9275\%$$

## Exercise

Suppose that at the beginning of 2004 you invested \$10,000 in the Stivers mutual fund and \$5,000 in the Trippi mutual fund. The value of each investment at the end of each subsequent year is provided in the table below. Which mutual fund performed better?

| Year | Stivers | Trippi |
|------|---------|--------|
| 2004 | 11,000  | 5,600  |
| 2005 | 12,000  | 6,300  |
| 2006 | 13,000  | 6,900  |
| 2007 | 14,000  | 7,600  |
| 2008 | 15,000  | 8,500  |
| 2009 | 16,000  | 9,200  |
| 2010 | 17,000  | 9,900  |
| 2011 | 18,000  | 10,600 |

## Percentiles

- A percentile provides information about how the data are spread over the interval from the smallest value to the largest value.
- Admission test scores for colleges and universities are frequently reported in terms of percentiles.
- The  $p$ th percentile of a data set is a value such that at least  $p$  percent of the items take on this value or less and at least  $(100 - p)$  percent of the items take on this value or more.
- Arrange the data in ascending order.
- Compute  $L_p$ , the location of the  $p$ th percentile.

$$L_p = (p/100)(n + 1)$$

## 80<sup>th</sup> Percentile

- Example: Apartment Rents

$$L_p = (p/100)(n + 1) = (80/100)(70 + 1) = 56.8$$

(the 56<sup>th</sup> value plus .8 times the  
difference between the 57<sup>th</sup> and 56<sup>th</sup> values)

$$\text{80th Percentile} = 635 + .8(649 - 635) = 646.2$$

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 525 | 530 | 530 | 535 | 535 | 535 | 535 | 535 | 540 | 540 |
| 540 | 540 | 540 | 545 | 545 | 545 | 545 | 545 | 550 | 550 |
| 550 | 550 | 550 | 550 | 550 | 560 | 560 | 560 | 565 | 565 |
| 565 | 570 | 570 | 572 | 575 | 575 | 575 | 580 | 580 | 580 |
| 580 | 585 | 590 | 590 | 590 | 600 | 600 | 600 | 600 | 610 |
| 610 | 615 | 625 | 625 | 625 | 635 | 649 | 650 | 670 | 670 |
| 675 | 675 | 680 | 690 | 700 | 700 | 700 | 700 | 715 | 715 |

## 80<sup>th</sup> Percentile

- Example: Apartment Rents

“At least 80% of the items take on a value of 646.2 or less.”

$$56/70 = .8 \text{ or } 80\%$$

“At least 20% of the items take on a value of 646.2 or more.”

$$14/70 = .2 \text{ or } 20\%$$

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 525 | 530 | 530 | 535 | 535 | 535 | 535 | 535 | 540 | 540 |
| 540 | 540 | 540 | 545 | 545 | 545 | 545 | 545 | 550 | 550 |
| 550 | 550 | 550 | 550 | 550 | 560 | 560 | 560 | 565 | 565 |
| 565 | 570 | 570 | 572 | 575 | 575 | 575 | 580 | 580 | 580 |
| 580 | 585 | 590 | 590 | 590 | 600 | 600 | 600 | 600 | 610 |
| 610 | 615 | 625 | 625 | 625 | 635 | 649 | 650 | 670 | 670 |
| 675 | 675 | 680 | 690 | 700 | 700 | 700 | 700 | 715 | 715 |

# Quartiles

- Quartiles are specific percentiles.
- First Quartile (Q1) = 25th Percentile
- Second Quartile (Q2) = 50th Percentile = Median
- Third Quartile (Q3) = 75th Percentile

## Third Quartile (75<sup>th</sup> Percentile)

- Example: Apartment Rents

$$L_p = (p/100)(n + 1) = (75/100)(70 + 1) = 53.25$$

(the 53<sup>rd</sup> value plus .25 times the difference between the 54<sup>th</sup> and 53<sup>rd</sup> values)

$$\text{Third quartile} = 625 + .25(625 - 625) = 625$$

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 525 | 530 | 530 | 535 | 535 | 535 | 535 | 535 | 540 | 540 |
| 540 | 540 | 540 | 545 | 545 | 545 | 545 | 545 | 550 | 550 |
| 550 | 550 | 550 | 550 | 550 | 560 | 560 | 560 | 565 | 565 |
| 565 | 570 | 570 | 572 | 575 | 575 | 575 | 580 | 580 | 580 |
| 580 | 585 | 590 | 590 | 590 | 600 | 600 | 600 | 600 | 610 |
| 610 | 615 | 625 | 625 | 625 | 635 | 649 | 650 | 670 | 670 |
| 675 | 675 | 680 | 690 | 700 | 700 | 700 | 700 | 715 | 715 |

## Measures of Variability

- It is often desirable to consider measures of variability (dispersion), as well as measures of location.
- For example, in choosing supplier A or supplier B we might consider not only the average delivery time for each, but also the variability in delivery time for each.

## Measures of Variability

- Range
- Interquartile Range (四分位距)
- Variance 變異數,
- Standard Deviation
- Coefficient of Variation (變異係數)

# Range

- The range of a data set is the difference between the largest and smallest data value.

$$\text{Range} = \text{Largest value} - \text{Smallest value}$$

- It is the simplest measure of variability.
- It is very sensitive to the smallest and largest data values.

## Range

- Example: Apartment Rents

Range = largest value - smallest value

$$\text{Range} = 715 - 525 = 190$$

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 525 | 530 | 530 | 535 | 535 | 535 | 535 | 535 | 540 | 540 |
| 540 | 540 | 540 | 545 | 545 | 545 | 545 | 545 | 550 | 550 |
| 550 | 550 | 550 | 550 | 550 | 560 | 560 | 560 | 565 | 565 |
| 565 | 570 | 570 | 572 | 575 | 575 | 575 | 580 | 580 | 580 |
| 580 | 585 | 590 | 590 | 590 | 600 | 600 | 600 | 600 | 610 |
| 610 | 615 | 625 | 625 | 625 | 635 | 649 | 650 | 670 | 670 |
| 675 | 675 | 680 | 690 | 700 | 700 | 700 | 700 | 715 | 715 |

## Interquartile Range (四分位距)

- The interquartile range of a data set is the difference between the third quartile and the first quartile ( $Q3 - Q1$ ).
- It is the range for the middle 50% of the data.
- It overcomes the sensitivity to extreme data values.

## Interquartile Range (IQR)

- Example: Apartment Rents

3rd Quartile ( $Q3$ ) = 625

1st Quartile ( $Q1$ ) = 545

$$\text{IQR} = Q3 - Q1 = 625 - 545 = 80$$

|     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 525 | 530 | 530 | 535 | 535 | 535 | 535 | 535 | 540 | 540 |
| 540 | 540 | 540 | 545 | 545 | 545 | 545 | 545 | 550 | 550 |
| 550 | 550 | 550 | 550 | 550 | 560 | 560 | 560 | 565 | 565 |
| 565 | 570 | 570 | 572 | 575 | 575 | 575 | 580 | 580 | 580 |
| 580 | 585 | 590 | 590 | 590 | 600 | 600 | 600 | 600 | 610 |
| 610 | 615 | 625 | 625 | 625 | 635 | 649 | 650 | 670 | 670 |
| 675 | 675 | 680 | 690 | 700 | 700 | 700 | 700 | 715 | 715 |

## Variance (變異數)

- The variance is a measure of variability that utilizes all the data.
- It is based on the difference between the value of each observation ( $x_i$ ) and the mean ( $\bar{x}$  for a sample,  $\mu$  for a population).
- The variance is useful in comparing the variability of two or more variables.
- The variance is the average of the squared deviations between each data value and the mean.
- The variance is computed as follows:

$$s^2 = \frac{\sum (x_i - \bar{x})^2}{n - 1} \quad \sigma^2 = \frac{\sum (x_i - \mu)^2}{N}$$

for a                      for a  
sample                      population

# Degrees of Freedom

- The concept of degrees of freedom is central to the principle of estimating statistics of populations from samples of them. "Degrees of freedom" is commonly abbreviated to df.
- The number of degrees of freedom generally refers to the number of independent observations in a sample minus the number of population parameters that must be estimated from sample data.
- The degrees of freedom of an estimate is the number of independent pieces of information on which the estimate is based.

**TABLE 3.3** COMPUTATION OF DEVIATIONS AND SQUARED DEVIATIONS ABOUT THE MEAN FOR THE CLASS SIZE DATA

| Number of<br>Students in<br>Class ( $x_i$ ) | Mean<br>Class<br>Size ( $\bar{x}$ ) | Deviation<br>About the Mean<br>( $x_i - \bar{x}$ ) | Squared Deviation<br>About the Mean<br>( $x_i - \bar{x})^2$ |
|---|-------------------------------------|--|---|
| 46  | 44                                  | 2  | 4   |
| 54  | 44                                  | 10   | 100   |
| 42  | 44                                  | -2   | 4   |
| 46  | 44                                  | 2  | 4   |
| 32  | 44                                  | -12  | 144   |
|   |                                     | 0  | 256   |
|   |                                     | $\Sigma(x_i - \bar{x})$                            | $\Sigma(x_i - \bar{x})^2$                                   |

$$s^2 = \frac{\Sigma(x_i - \bar{x})^2}{n - 1} = \frac{256}{4} = 64$$

**TABLE 3.4** COMPUTATION OF THE SAMPLE VARIANCE FOR THE STARTING SALARY DATA

| Monthly Salary<br>( $x_i$ ) | Sample Mean<br>( $\bar{x}$ ) | Deviation About the Mean<br>( $x_i - \bar{x}$ ) | Squared Deviation About the Mean<br>( $x_i - \bar{x}$ ) <sup>2</sup> |
|-----------------------------|------------------------------|---|--|
| 3850                        | 3940                         | -90   | 8,100  |
| 3950                        | 3940                         | 10  | 100  |
| 4050                        | 3940                         | 110   | 12,100   |
| 3880                        | 3940                         | -60   | 3,600  |
| 3755                        | 3940                         | -185  | 34,225   |
| 3710                        | 3940                         | -230  | 52,900   |
| 3890                        | 3940                         | -50   | 2,500  |
| 4130                        | 3940                         | 190   | 36,100   |
| 3940                        | 3940                         | 0   | 0  |
| 4325                        | 3940                         | 385   | 148,225  |
| 3920                        | 3940                         | -20   | 400  |
| 3880                        | 3940                         | -60   | 3,600  |
|                             |                              | 0   | 301,850  |
|                             |                              | $\Sigma(x_i - \bar{x})$                         | $\Sigma(x_i - \bar{x})^2$  |

Using equation (3.7),

$$s^2 = \frac{\Sigma(x_i - \bar{x})^2}{n - 1} = \frac{301,850}{11} = 27,440.91$$

## Standard Deviation (標準差)

- The standard deviation of a data set is the positive square root of the variance.
- It is measured in the same units as the data, making it more easily interpreted than the variance.
- The standard deviation is computed as follows:

$$s = \sqrt{s^2}$$

for a  
sample

$$\sigma = \sqrt{\sigma^2}$$

for a  
population

## Coefficient of Variation (變異係數)

- The coefficient of variation indicates how large the standard deviation is in relation to the mean.
- The coefficient of variation is computed as follows:

$$\left[ \frac{s}{\bar{x}} \times 100 \right] \%$$

for a  
sample

$$\left[ \frac{\sigma}{\mu} \times 100 \right] \%$$

for a  
population

## Sample Variance, Standard Deviation, And Coefficient of Variation

- Example: Apartment Rents

- Variance

$$s^2 = \frac{\sum (x_i - \bar{x})^2}{n-1} = 2,996.16$$

- Standard Deviation

$$s = \sqrt{s^2} = \sqrt{2,996.16} = 54.74$$

- Coefficient of Variation

$$\left[ \frac{s}{\bar{x}} \times 100 \right] \% = \left[ \frac{54.74}{590.80} \times 100 \right] \% = 9.27\%$$

Mean absolute error (平均絕對誤差 , MAE)

$$MAE = \frac{\sum |x_i - \bar{x}|}{n}$$

Class size data:  $MAE = \frac{28}{5} = 5.6$
